

AMMUNITION · CGI & 3D CAPABILITIES

Automotive *CGI*

*Advertising-grade vehicle imagery for marketing,
sales, and engineering — built in CG.*

01 / 05

CGI & *Visualization*

Faster and at lower cost than traditional production.

Photorealistic vehicle and parts rendering for advertising, marketing, and engineering — every surface, finish, and reflection built to spec.

02 / 05

Environment & *Lighting*

HDRI and backplate compositing that places CG assets into authentic real-world settings — with accurate shadow, reflection, and atmosphere.

03 / 05

Technical & *Cutaway* Renders

CAPABILITIES

STUDIO POWERTRAIN · FULL CG BUILD

03 / DETAIL

Exploded views & *cross-sections*

Every system made legible — the same asset, dissected for engineering review, the showroom, and the screen.

Retouching & *Post-Production*

Full compositing, color grading, and asset delivery — one master build, finished and conformed across every format and spec.

Next-generation *pipeline*

Ammunition builds on industry-standard tools — 3ds Max, Blender, Cinema 4D — and is actively integrating NVIDIA Omniverse as a centralized production pipeline.

Omniverse runs on the Universal Scene Description (USD) format — a single unified project file accessible from any application or workstation. It removes handoff friction between artists, reduces version-control risk, and lets **modeling, lighting, and animation** specialists work concurrently on the same asset.

For automotive clients, that means faster iteration, tighter cross-discipline collaboration, and a future-proofed asset library that travels cleanly from production into real-time and AI-assisted rendering.

AI-augmented *production*

AI generation is built directly into the 3D production pipeline — not as a replacement for craft, but as *an accelerant*. The result: faster turnaround, greater creative range, and a pipeline that scales without sacrificing visual fidelity.

It's applied selectively across the workflow — generating environment backplates, HDRI lighting, producing accessory and surface elements, and accelerating asset iteration. Real-time 3D remains the backbone: AI fills the gaps, reduces manual bottlenecks, and expands what's achievable within a given timeline and budget.
